

Greenenergy fuel supply in Brazil

Creating efficient supply chains

Greenenergy imports fuel products to meet contracted customer requirements

Customers indicate their supply requirements

Greenenergy finds lowest-cost available product globally and makes firm offer to customers

Customers commit to a quantity and price by contract

Greenenergy purchases product, arranges shipment and imports into Brazil

Customer makes payment and schedules lifting

Payment must be received in full before product can be released from the terminal

Once payment is received, a lot is created under the customer's name in the terminal system and the customer can schedule liftings on the terminal's website

Customers collect from the terminal

To ensure efficient road loading customers should:

Ensure their balance is positive at all times. Waiting for a payment to clear creates delays, reduces customers' fleet utilisation and increases haulage costs. Greenenergy keeps every customer aware of its balance on a daily basis

Ensure that product is scheduled evenly through the week, including on weekends and Mondays. This allows more product to go through the tanks, creating cost efficiencies that can be shared with customers
